### **List of contributors**

Alfred Owino (Kenya Wildlife Service), Charlie Marsh, Claudien Nsabasagani (Association pour la Conservation de la Nature au Rwanda – ACNR and Karisoke Research Center), David Stroud (UK, JNCC - AEWA TC observer), Dieudonné Bizimana (Association Burundaise pour la Protection des Oiseaux), Frank Hawkins (Conservation International), Fred Barasa (National Museums of Kenya), Gérard Rocamora (Island Conservation Society - Seychelles), Henry Ndithia (National Museum of Kenya), Jarton Shawa (South Luagwa Area Management Unit, Zambia), Jasson John (University of Dar Es Salaam), Jean Rushemeza (Management & Ecotourism in Protected Areas, Burundi), Jelena Kralj (Croatia, AEWA Technical Committee), Julien Ramanampamony (ASITY Madagascar), Justin Gerlach (Nature Protection Trust for Seychelles), Lindsay Chong-Seng (Seychelles Islands Foundation), Lizanne Roxburgh (Zambian Ornithology Society), Luca Borghesio, Marc Salamolard (Société d'études ornithologiques de la Réunion - SEOR), Michel Clément, Michel Louette (Royal Museum for Central Africa), Mzamiru Kaita (Wildlife Division - Tanzania), Neil Baker (Tanzania Bird Atlas), Niels Kanstrup (Denmark, CIC, AEWA Technical Committee member), Potiphar Kaliba (National Museums of Malawi), Rivo Rabarisoa (ASITY Madagascar), Roger Safford (BirdLife International), Samuel Kamoto (Wildlife and Environment Society of Malawi), Sergey Dereliev (UNEP/AEWA Secretariat), Tim Dodman (Wetlands International)

### **Milestones in the production of the plan**

Workshop: 14 -16 April 2008 in Nairobi, Kenya

First draft: 10 June 2008, presented to experts

Second draft: 29 July 2008 presented to Range States and AEWA Technical Committee

Third draft: September 2008, adopted by the 4<sup>th</sup> session of the Meeting of the Parties to AEWA in September 2008 and the 9<sup>th</sup> session of the Conference of the Parties to CMS in December 2008

### **Geographical Scope**

This International Single Species Action Plan requires implementation in the following countries regularly supporting Madagascar Pond-heron: **Burundi, Comoro Islands, Democratic Republic of Congo, France** (Europa - Iles Eparses, administered from Réunion and Mayotte - eastern Comoro Island), **Kenya, Madagascar, Malawi, Mozambique, Rwanda, Seychelles** (Aldabra), **Uganda, United Republic of Tanzania, Zambia, Zimbabwe**.

### **Reviews**

This International Single Species Action Plan should be revised in 2018. An emergency review will be undertaken if there are sudden major changes liable to affect the population.

## Preface

This International Single Species Action Plan for the Conservation of the Madagascar Pond-heron (*Ardeola idae*) was commissioned to the BirdLife International Africa Partnership Secretariat and compiled by the Species Programme Manager, Mr. Paul Kariuki Ndang'ang'a and Eric Sande, Lecturer at the Zoology Department of the Makarere University in Kampala, Uganda. The drafts of the plan went through rigorous consultations including comments from experts, governmental officials from the Range States, CMS Scientific Council Members and the AEWA Technical Committee. The third draft was adopted by the 4<sup>th</sup> session of the Meeting of the Parties to AEWA in September 2008 and the 9<sup>th</sup> session of the Conference of the Parties to CMS in December 2008. The Action Plan follows the format for Single Species Action Plans approved by the 2<sup>nd</sup> Session of the Meeting of the Parties to AEWA in September 2002.

**ZICOMA:** Zones d'Importance pour la Conservation des Oiseaux a Madagascar. Antananarivo

## Executive Summary

The Madagascar Pond-heron *Ardeola idae* is listed as Endangered in the IUCN Red List. This is because it has a very small population (estimated at 2,000 – 6,000 individuals) which is undergoing a continuing decline. Whilst it remains fairly widespread in Madagascar, populations are low. It breeds from October to March in Madagascar, Aldabra (Seychelles), Mayotte (eastern Comoro Island, France) and Europa (Iles Eparses, administered from Réunion, to France). It has a large non-breeding range in Central and East Africa including the Comoro Islands, Mozambique, Zimbabwe, Zambia, Malawi, the United Republic of Tanzania, Kenya, Uganda, Burundi, Rwanda and the Democratic Republic of Congo; and is also a vagrant in Angola and Somalia.

The main threats directly or indirectly affecting the Madagascar Pond-heron include habitat destruction and degradation; human disturbance at nesting sites; reduced nesting sites leading to competition for nesting, feeding and roosting sites; and collection of eggs and young birds. In Madagascar, there is increasing evidence of hybridisation with the much more common Squacco Heron *A. ralloides*, although the latter does not breed on Mayotte, Aldabra or the Comoros.

The purpose of this action plan is to improve the current conservation status and knowledge base of the Madagascar Pond-heron within the next 10 years. The following are among the priority conservation actions recommended to address the identified threats in order to achieve this purpose: (1) regulate access to sites during the breeding season, including designing and implementing community-run control, (2) develop and/or support the implementation of existing management plans of the known breeding sites, (3) prevent development which will reduce the species' breeding habitat, (4) designate all breeding sites under national protected area legislation and as Ramsar sites, (5) implement EIA studies in the species habitats before any development, (6) make the status, threats and the species' priority actions more known and appreciated by the general public, (7) perform coordinated censuses in all countries and conduct training for data collectors in identification and survey techniques in order to determine the actual population size and trends, (8) undertake research to determine the extent, impacts and causes of hybridisation of *A. idae* with *A. ralloides*, (9) implement field surveys to identify all breeding colonies in Madagascar and key sites in the non-breeding range, and (10) study the habitat requirements of the species.

Emphasis for site conservation activities will focus on Madagascar, Mayotte, Aldabra and Europa where the species breeds, because the main threats to the species' survival appear to relate to breeding.

## 1. Biological Assessment

<b>General Information</b>	<p>The Madagascar Pond-heron <i>Ardeola idae</i> is a small (45-48 cm) white heron with reddish legs. In breeding plumage it is all white, with long crest and scapular plumes. It has a blue bill and bare orbital skin, the former with dark tip. In non-breeding plumage, it is dark brown on crown and streaked dark brownish on mantle and underparts. It is found singly or in small groups, often with Squacco Heron <i>A. ralloides</i> or egrets. It nests colonially with other herons.</p> <p>It is listed as Endangered in the 2008 IUCN Red List because it has a very small population that is undergoing a continuing decline as a result of many of its breeding colonies being heavily and increasingly exploited for eggs and young (BirdLife International 2008). This exploitation is exacerbated by pressures on its wetland habitats.</p> <p>Currently, the Madagascar Pond-heron is listed in Appendix II (Migratory species conserved through Agreements) of CMS<sup>1</sup> and in Column A, Categories 1b and 1c of the AEWA Table 1<sup>2</sup>.</p>
<b>Taxonomy and Systematics</b>	<p><b>Phylum:</b> Chordata  <b>Class:</b> Aves  <b>Order:</b> Ciconiiformes  <b>Suborder:</b> Ardeae  <b>Family:</b> Ardeidae  <b>Subfamily:</b> Ardeinae  <b>Genus:</b> <i>Ardeola</i> (Boie)  <b>Species:</b> <i>Ardeola idae</i> (Hartlaub, 1860)  <i>Ardea idae</i> Hartlaub, 1860. Journal of Ornithology 8, p. 167; east coast of Madagascar.  <b>Alternative names:</b> Malagasy Pond Heron, Madagascar Squacco Heron  <b>Taxonomic sources:</b> Dowsett and Forbes-Watson (1993), Sibley and Monroe (1990, 1993)</p>

<sup>1</sup> Migratory species that have an unfavourable conservation status or would benefit significantly from international cooperation organised by tailored agreements are listed in Appendix II to CMS. For this reason, the Convention encourages the Range States to conclude global or regional Agreements for the conservation and management of individual species or, more often, of a group of species listed on Appendix II.

<sup>2</sup> AEWA provides for coordinated and concerted action to be taken by the Range States throughout the migration system of waterbirds to which it applies.

- Category 1: (a) Species which are included in Appendix I to the Convention on the Conservation of Migratory species of Wild Animals;  
 (b) Species which are listed as threatened in Threatened Birds of the World (BirdLife International 2008); or  
 (c) Populations, which number less than around 10,000 individuals.

<b>Population Development</b>	<p>There is one population which breeds in small colonies in many places in Madagascar (F. Hawkins <i>per</i> Dodman, 2002), on Aldabra, where the main known breeding site is, Ile aux Aigrettes (Betts 2002), in Mayotte (2 breeding sites known: Clément <i>com. pers.</i>) and on the atoll of Europa in the Mozambique Channel. F. Hawkins (<i>per</i> Dodman 2002) believes that colony size in Madagascar is often less than 10 pairs, and there might be 100-200 colonies or perhaps substantially fewer, giving a maximum estimate of some 6,000 birds, and minimum of 2,000. One of the highest counts is from Lac Alarobia or Tsarasaotra near Antananarivo, where there were 162 individuals in January 1998 (Dodman <i>et al.</i> 1999). However, no other sites meet the previous 1% level of 100 (a threshold used for instance in the IBA programme, determined before the more recent, lower population estimate of 2,000-6,000). This is despite its occurrence at a large number of sites. This indeed suggests that numbers in Madagascar are considerably lower. The population on Mayotte is estimated to be between 50 and 100 individuals, with variation over the years; up to 10 nests were found in 2007 in mixed colonies with Cattle Egrets (<i>Bubulcus ibis</i>), but total nests of Madagascar Pond-heron were surely &gt;10 (Clément <i>com. pers.</i>). Rocamora and Skerrett (2001) estimate the Aldabra population to be 20-50 pairs. The population on Europa numbered up to 15 pairs in 1996 (Le Corre and Safford 2001). The population estimate of 2,000-6,000 was therefore proposed, based mainly on this breeding information.</p> <p>Whilst the species remains fairly widespread, populations are low, and increasing exploitation at breeding sites is likely to increase the rate of population decline (ZICOMA 1999). As a result, a rapid and on-going population decline is suspected (BirdLife International 2008).</p>
<b>Distribution throughout the Annual Cycle</b>	<p>It breeds on Madagascar, Aldabra in Seychelles, Mayotte (Comoro Island, France), and Europa (France). It has a large non-breeding range in Central and East Africa including the Comoro Islands, Mozambique, Zimbabwe, Zambia, Malawi, United Republic of Tanzania, Kenya, Uganda, Burundi, Rwanda and the Democratic Republic of Congo (BirdLife International 2008); and is also a vagrant in Angola and Somalia (Dean 2000). Details of exact localities where the species has ever been recorded are provided in Figure 1 and Annex 1. It is present almost throughout Madagascar, but is always uncommon (ZICOMA 1999). It is rare in the south and probably commonest in suitable wetlands in the west (Morris and Hawkins 1998).</p>
<b>Survival and Productivity</b>	No data.
<b>Life History: Breeding</b>	<p>It breeds from October to March, beginning around the start of rains (rains begin around November). It is colonial, usually in mixed colonies, in Madagascar especially with <i>A. ralloides</i> and with <i>Bubulcus ibis</i> in Mayotte; colonies formerly contained up to 1,000 nests of present species.</p>

	<p>It nests in trees, bushes or shrubs near water, 0.5-4 m up; in mixed colonies, nests of present species tend to be higher than those of <i>A. ralloides</i> in Madagascar; in Mayotte, nests tend to be in the middle and lower than the nests of <i>Bubulcus ibis</i> in a mixed breeding colony located in a mangrove (Clément com. pers.); the nest is made of interlaced twigs. Normally 3 eggs (2-4); incubation c. 20 days; chicks have buffy yellow down; start to leave nest at c. 15 days, and can feed alone at under 4 weeks old. Normally single clutch, but a second may be laid in February-March. Afterwards dispersing to mainland Africa to spend the non-breeding season.</p>
<b>Life History: Feeding</b>	<p>It feeds on small fish, reptiles (lizards and geckos), amphibians (frogs) and small invertebrates including grasshoppers and beetles. Mostly in fresh water habitat, usually at pond edges, dams and sluggish rivers in wooded areas or fringing vegetation. In Mayotte, despite breeding colonies being found in mangroves, feeding is in fresh water (M. Salamolard pers. com). It is a secretive, solitary feeder, only rarely forming flocks. On Aldabra, birds feed mainly alongside other heron species. Prey is caught mainly by walking slowly or standing motionless at the water's edge, in shallow water or on floating vegetation. Most of the feeding observations have been done from the breeding range.</p>
<b>Life History: Outside Breeding Season</b>	No data.
<b>Habitat Requirements: Breeding</b>	Shallow water bodies fringed with vegetation or with floating vegetation, including marshes, lakes, ponds, slow-flowing rivers, rice fields; mangroves on Aldabra and Mayotte. Typical forest species which takes refuge in trees when disturbed.
<b>Habitat Requirements: Feeding</b>	See below – outside breeding season and above: in breeding season
<b>Habitat Requirements: Outside Breeding Season</b>	Outside the breeding season, it is found along the banks of small streams, including those inside forests. It is also found on rice paddies, and more rarely in mangroves and on the seashore. It is migratory but <i>ad hoc</i> data suggests some site fidelity and residence in suitable habitat; in Tanzania largely restricted to small wetlands, ponds, dams with adjacent bushes or small trees.

Table 2.3: Information from breeding colonies of Madagascar Pond-heron

Country	Colony	Year of breeding	No. of Breeding pairs	Other species in mixed colonies	Breeding success (no. fledglings/BP)	Legal status of the site	Conservation problem
Madagascar	Alarobia or Tsarasaotra Lake	1996 1997	234 pairs 70 pairs	<i>Ardeola ralloides, Bulbulcus ibis, Egretta dimorpha, Egretta alba, Nycticorax nycticorax, Butorides striatus, Anas erythrorhyncha, Anas hottentota, Sarkidiornis melanotos, Dendrocygna viduata</i>	Unknown - Difficult to count young birds - mixed	Private Park; Ramsar site	Nesting habitat small and high competition from species in the colony; some young MPH eaten by <i>Nycticorax nycticorax</i>

### 3. Threats

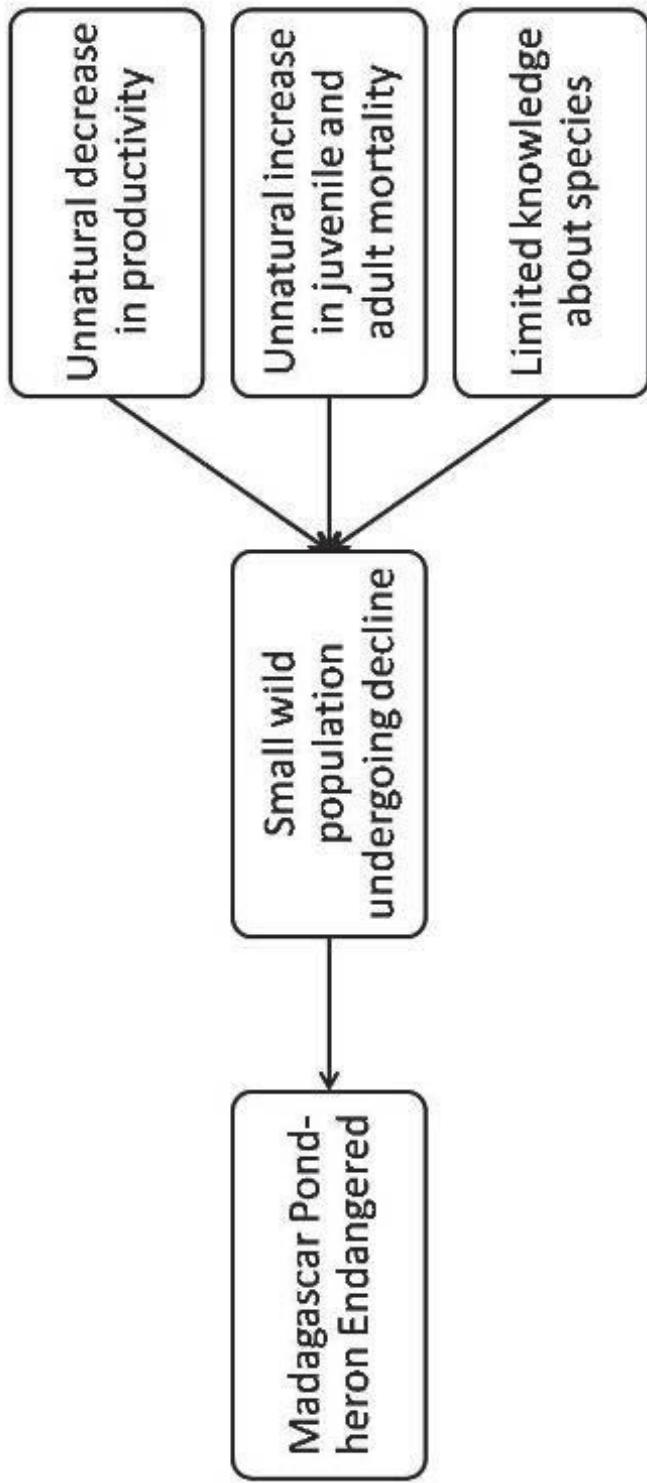

The Madagascar Pond-heron is listed as Endangered on the IUCN Red List of Threatened Species because it has a very small population which is undergoing a continuing decline due to a combination of factors. The main ones include: (1) its wetland habitats are facing large-scale ecological transformation due to drainage especially for agriculture; (2) there is increased competition from other herons (especially the more common *A. ralloides* in Madagascar); (3) in Madagascar, there is increasing evidence of hybridisation with the much more common Squacco Heron *A. ralloides*, although the latter does not breed on Mayotte, Aldabra or the Comoros; (4) many of its breeding colonies are heavily and increasingly exploited for eggs and young especially in Madagascar; and (5) disturbance especially at breeding sites.

The inability to identify the species properly in the field, and differentiate it from the *A. ralloides* is another problem facing field workers and is likely to affect any legislation in non-breeding countries. Knowledge on the species is generally limited, especially regarding the following aspects (1) population size and trends; (2) location of all breeding sites in Madagascar; (3) details regarding extent, impact and causes of hybridisation with *A. ralloides*; (4) habitat requirements especially in the non-breeding range; and (5) ecology of the species. These knowledge gaps are obvious research priorities which need to be filled in order to conserve the species.

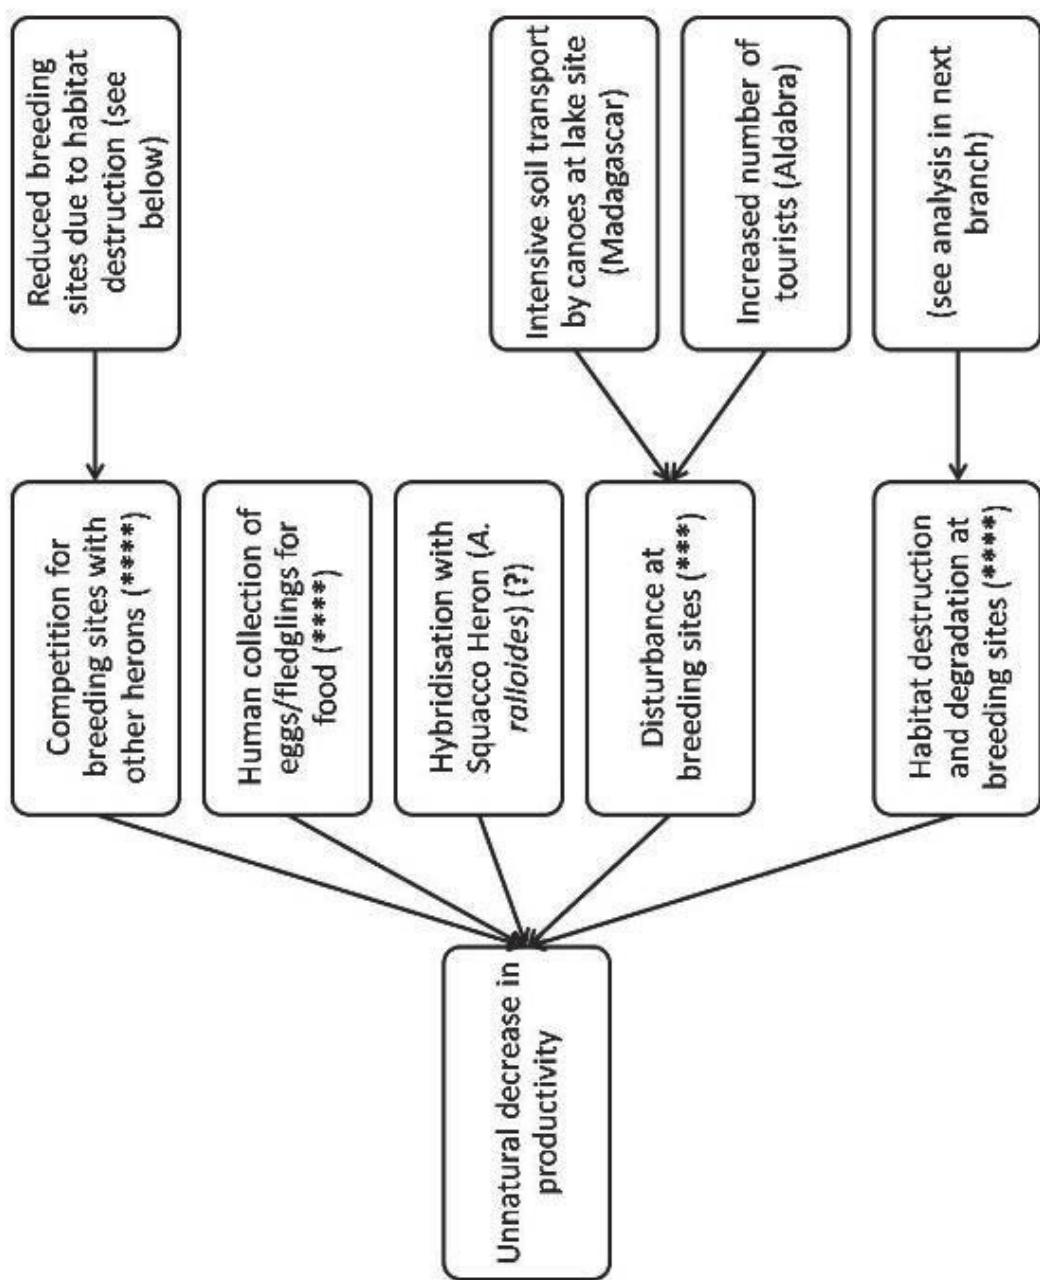

The threats facing this species are analysed in detail using a problem tree (Figure 2).

## 5. Framework for Action

**Goal:** To ensure favourable conservation status of the Madagascar Pond-heron

**Purpose:** Improve the current conservation status and knowledge base of the Madagascar Pond-heron within the next 10 years

Table 5.1: Objectives and indicators

Objectives	Indicators
<b>Objective 1:</b> To reduce and manage human disturbance at breeding sites	No human disturbance during the presence of species at sites other than managed visits
<b>Objective 2:</b> To limit and reverse human activities that reduce or degrade the species' habitat	Management actions on the ground aimed at maintaining the species' habitat in at least 50% of key sites in 10 years.
<b>Objective 3:</b> To prevent exploitation of the species' eggs and young.	No unmanaged access by people and animals in core areas during breeding season
<b>Objective 4:</b> To raise the species' profile in the range states	At least one new Madagascar Pond-heron site gets legal protection status (Protected Area, or Community-based conservation in the first 5 years)
<b>Objective 5:</b> To determine the actual population size and trends and undertake appropriate training in proper field identification of <i>A. idae</i> .	Populations and trends determined
<b>Objective 6:</b> To determine the extent, impacts and causes of hybridisation of <i>A. idae</i> with <i>A. ralloides</i> .	Research outputs of scientific investigations
<b>Objective 7:</b> To establish the extent of the species' range and distribution with a focus on identifying all breeding localities	Range and distribution mapped
<b>Objective 8:</b> To study the species' survival and productivity, as well as life history outside the breeding season	Research outputs of scientific investigations
<b>Objective 9:</b> To determine the species' habitat requirements and references	Research outputs of scientific investigations

Table 5.2: Actions, their relative importance, time scale and lead agencies

Action	Priority	Time Scale	Lead agency
<b>Objective 1: To reduce and manage human disturbance at breeding sites</b>			
<b>1.1</b> Designate key breeding sites as Ramsar sites	Critical	5 years	Government agencies
<b>1.2</b> Develop and implement site visitation protocol for birdwatchers at the species' sites	Low	2 years	Government agencies, Conservation NGOs
<b>1.3</b> Regulate access to sites during the breeding season, including designing and implementing community-run control of access.	Critical	Ongoing	Government agencies, Conservation NGOs, Community-based local conservation groups
<b>1.4</b> Develop and or support the implementation of existing management plans of the known breeding sites	Critical	Ongoing	Government agencies, Conservation NGOs
<b>1.5</b> Prevent development which will reduce species' breeding habitat	Critical	Ongoing	Government agencies, Conservation NGOs
<b>1.6</b> Purchase some sites that hold key breeding colonies/ heronries as reserves	Medium	Medium	Government agencies, Conservation NGOs
<b>Objective 2: To limit and reverse human activities that reduce or degrade the species' habitat</b>			
<b>2.1</b> Analyse the existing habitat images to establish the temporal changes of the species' habitats in key sites using remote sensing	Medium	2 years	Government agencies, Conservation NGOs
<b>2.2</b> Designate all breeding sites under national protected area legislation	Critical	5 years	Government agencies

Action	Priority	Time Scale	Lead agency
<b>2.3</b> Prevent development which will reduce species' habitat	Critical	Ongoing	Government agencies
<b>2.4</b> Implement EIA studies in species habitats before any development	Critical	Ongoing	Government agencies, Conservation NGOs
<b>2.5</b> Prevent harvesting of <i>Typha</i> at species' roosting sites	High	Ongoing	Government agencies, Conservation NGOs
<b>2.6</b> Engage communities in conservation of species' habitat through support and expansion of local conservation groups, e.g. SSGs and their activities	Medium		Government agencies, Conservation NGOs, Community-based local conservation groups
<b>2.7</b> Develop and/or support the implementation of existing management plans of the known non breeding sites	High	Ongoing	Government agencies, Conservation NGOs
<b>Objective 3: To prevent exploitation of the species' eggs and young.</b>			
▪ (Activities as in objective 1)			
<b>Objective 4: Raise the species' profile in the range states</b>			
<b>4.1</b> Make the status, threats and the species' priority actions more known and appreciated by the general public	Critical	Medium	Government agencies, Conservation NGOs
<b>4.2</b> Develop and distribute advocacy materials e.g. posters, leaflets and put information on websites to raise awareness about the species in the public at national and regional levels	Critical	Medium	Government agencies, Conservation NGOs
<b>4.3</b> Capture information about the species in field workers' periodic reports in addition to other globally threatened, CMS/AEWA species	Medium	Ongoing	Government agencies, Conservation NGOs

Action	Priority	Time Scale	Lead agency
<b>4.4</b> Include Madagascar Pond-heron in media campaign (radio, TV, newspapers) together with other threatened, CMS and AEWA species	Medium	Ongoing	Government agencies, Conservation NGOs
<b>4.5</b> Include Madagascar Pond-heron in existing special events for threatened, CMS and AEWA species e.g. World Wetlands Day and World Migratory Bird Day (WMBD) etc.	High	Ongoing	Government agencies, Conservation NGOs
<b>4.6</b> Include the species in relevant stakeholder meetings at local, national and regional levels	High	Ongoing	Government agencies, Conservation NGOs
<b>4.7</b> Include the species and other water birds in the ongoing training programs for staff, conservationists and students to improve species identification skills, survey techniques, etc	Medium	Ongoing	Government agencies, Conservation NGOs
<b>4.8</b> Support and expand community conservation groups and their activities	Medium	Ongoing	Government agencies, Conservation NGOs
<b>Objective 5: To determine the actual population size and trends and undertake appropriate training in proper field identification of <i>A. idaei</i>.</b>			
<b>5.1</b> Develop identification kit and guide for herons	Medium	1 year	Research institutions, Birding organisations, Government agencies, Conservation NGOs
<b>5.2</b> Identify and investigate all of the suitable sites throughout Madagascar	High	2 years	Research institutions, Birding organisations, Government agencies, Conservation NGOs
<b>5.3</b> Develop a suitable census technique	High	3 years	Research institutions, Government agencies,

Action	Priority	Time Scale	Lead agency
<b>5.4</b> Organise and conduct training for data collectors in identification, survey techniques and data management	High	Ongoing	Research institutions, Government agencies, Wetlands International
<b>5.5</b> Perform coordinated censuses in all countries	Critical	Ongoing	Research institutions, Government agencies, Wetlands International, Other NGOs
<b>Objective 6: To determine the extent, impacts and causes of hybridisation of <i>A. idae</i> with <i>A. ralloides</i></b>			
<b>6.1</b> Design and implement a scientific study, e.g. genetic studies	Critical	5 years	Research institutions, Government agencies
<b>Objective 7: To establish the species' range and distribution with a focus on identifying all breeding localities</b>			
<b>7.1</b> Implement a field programme to identify all the breeding colonies in Madagascar	Critical	3 years	Research institutions, Government agencies
<b>7.2</b> Identify key sites in non-breeding range	Critical	3 years	Research institutions, Government agencies
<b>7.3</b> Initiate/strengthen waterbird databases in range states and ensure that the Madagascar Pond-heron is included	High	Ongoing	Research institutions, Government agencies
<b>7.4</b> Create an international network of people and institutions interested in the Madagascar Pond-heron and share information through the network	Medium	1 year	Research institutions, Government agencies
<b>7.5</b> Encourage birdwatchers to submit records to the network	Medium	Ongoing	Research institutions, Government Agencies

Action	Priority	Time Scale	Lead agency
<b>Objective 8: To study the species' survival and productivity, as well as life history outside the breeding season</b>			
<b>8.1</b> Design and implement a scientific study	Medium	10 years	Research institutions, Government agencies
<b>8.2</b> Undertake population modeling	Medium	10 years	Research institutions, Government agencies
<b>Objective 9: To determine the species' habitat requirements</b>			
<b>9.1</b> Design and implement a scientific study to undertake detailed research on the habitat requirements of the species	Critical	10 years	Government agencies, Research institutions
<b>9.2</b> Initiate a pilot programme for creation of artificial breeding sites/structures	Medium	5 years	Research institutions, Government agencies

## 6. Monitoring and Evaluation

This will be done through tracking the level of implementation of various activities as outlined in the Actions table. A column will be added to this table in which assessment of progress (activity compared to indicator) will be explained. This table will be circulated to the Madagascar Pond-heron network for completion twice a year.

Activity	Priority	Time	Lead Agencies	Progress made (compare to indicators)

Twice per year, national contacts will evaluate progress nationally. The Africa Secretariat of BirdLife International in liaison with AEWA Secretariat will provide the global lead and the Madagascar Pond-heron network (working virtually by email) will fill in the table. The key drivers for this process will be **Julien Ramanampamony** (breeding range) and **Neil Baker** (non-breeding range).
