

- The presence or absence of adverse impacts on migratory species habitats due indirectly to fisheries or hunting.
- The presence or absence of adverse impacts on migratory routes due directly to fisheries or hunting.
- The presence or absence of adverse impacts on migratory routes due indirectly to fisheries or hunting.
- Safe ecological limits for the impacts of fisheries and hunting.

As with Target 5, the outcome sought by Target 6 may not need to involve a change, if impacts are within safe limits and are negligibly adverse at the outset. If impacts are not within safe limits and adverse impacts are significant, then this *would* be expected to change. In any case, demonstrating either a change or the maintenance of the *status quo* requires the information referred to above.

Definition and description: what kind(s) of indicator(s) could address this?

Although data exist in some places on some “outcome” aspects of this target (such as fish stocks that are regarded as overexploited), given the measurement challenge mentioned above, the most practical approach to indicators here is likely to be to assess the *activities* that are relevant, and to make a *reasoned assumption* about the effect of these activities on the ecological outcome, without attempting to measure the latter directly.

6.1 Trends in implementation of measures designed to minimise impacts of fisheries and hunting on migratory species, their habitats and their migratory routes.

Following the argument above, it is *reasonable to assume* that complying with internationally-agreed good practice standards concerning relevant measures will make a meaningful contribution towards achieving zero significant direct or indirect adverse impacts on migratory species, their habitats or their migration routes, and keeping impacts within safe ecological limits. Relevant measures in this context may include by-catch mitigation, hunting close seasons, minimum mesh sizes in nets and avoidance of toxic materials for shot or weights.

The indicator would be a composite indicator, composed from a variety of simple narrative or other inputs from different sources which are each addressing some aspect of this issue. The existing CMS National Report Format for example already asks Parties to provide information about measures undertaken in response to three COP Resolutions on by-catch, and the AEWA equivalent asks (*inter alia*) about prohibited modes of taking, phasing out of lead shot and control of illegal taking. Modified questions in future could potentially address further issues of relevance. Information from other sources (such as FAO) could also be incorporated into the composite narrative, as long as migratory species (or their habitats or migratory routes) are the focus.

The indicator is framed in terms of “trends in” implementation of the measures, in order to convey the intention to compile information on a periodic basis, to detect whether good situations are being maintained and whether situations of concern are improving.

6.2 Red List Index (impacts of fisheries on migratory species)

This indicator takes an analogous approach to that in Indicator 5.1 for target 5. Different drivers of genuine Red List category changes are coded separately in the Index, so it is possible to single out Index results that show changes attributed to fisheries (including both direct catch/bycatch and depletion of prey species). The migratory species sub-set would need to be disaggregated.

Baseline for measurement of the indicator(s), if relevant

Since the proposal in 6.1 is for a composite indicator, no single baseline will apply for that indicator. Baseline issues for indicator 6.2 are complex, but an appropriate approach to the requisite caveats etc can be derived from normal Red List Index methodologies.

Indicator factsheet for Target 7

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 7: Multiple anthropogenic pressures have been reduced to levels that are not detrimental to the conservation of migratory species or to the functioning, integrity, ecological connectivity and resilience of their habitats.

Note: The pressures concerned may include those relating to climate change, renewable energy developments, power lines, by-catch, underwater noise, ship strikes, poisoning, pollution, disease, invasive species, illegal and unsustainable take and marine debris.

Corresponding Aichi target(s), where applicable

Target 8: By 2020, pollution, including from excess nutrients, has been brought to levels that are not detrimental to ecosystem function and biodiversity.

Target 9: By 2020, invasive alien species and pathways are identified and prioritized, priority species are controlled or eradicated, and measures are in place to manage pathways to prevent their introduction and establishment.

Target 10: By 2015, the multiple anthropogenic pressures on coral reefs, and other vulnerable ecosystems impacted by climate change or ocean acidification are minimized, so as to maintain their integrity and functioning.

SPMS Goal to which the target relates

Goal 2: Reduce the direct pressures on migratory species and their habitats.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

This target does *not* expect a total inventory of all anthropogenic pressures on migratory species and their habitats, and it does not necessarily expect *all* such pressures to be reduced to non-detrimental levels. It may instead be fulfilled by reducing to such levels a sub-set of pressures that are selected for this attention (for example because they are the most urgent, or the best understood, or the most amenable to change, or for some other reason).

While the target therefore does not create an expectation of change in all relevant pressures, there should be a demonstrable change in a good number of them (“multiple”). Fully assessing the achievement of this target will require information on:

- The agreed definition of a range of types of pressures that can be assessed in this way.
- The presence of a detectable reduction in the “level” of a given pressure (which may involve a change in its magnitude, intensity, severity, duration, cumulative

impact, geographical spread or some other relevant parameter), perceived relative to a defined baseline state.

- The “level” of a given pressure that constitutes the threshold between detrimental and non-detrimental effects on migratory species.
- The “level” of a given pressure that constitutes the threshold between detrimental and non-detrimental effects on the functioning, integrity, ecological connectivity and resilience of the habitats of migratory species.
- The relationship at a defined point in time between the actual levels of pressure described above and the “threshold” levels described above.

If the “threshold” levels as described above can be known or plausibly proposed, then there is no need to assess the achievement of this target by direct measurements of the conservation status of the migratory species concerned, or of the functioning, integrity, ecological connectivity and resilience of their habitats (sometimes referred to as the “receiving environment”). If on the other hand in a given instance it proves more practical to measure these “ecological outcome” parameters, then the extent to which they are *attributable* to a reduction in the level of relevant pressures will need to be known.

Definition and description: what kind(s) of indicator(s) could address this?

Target 8 is concerned with the same ecological outcomes as Target 7 (and conceivably Target 8 is wider, being concerned in theory also with outcomes that are driven by non-anthropogenic pressures as well as those driven by anthropogenic ones). Notwithstanding the explanation in the “expected change” section above that Target 7 involves an “ecological outcome” result as well as a “reduced pressure” result, it makes sense to avoid duplication between indicators for Target 7 and Target 8, and accordingly the proposal here is to frame an indicator for Target 7 which concentrates purely on pressure-reduction.

7.1 Trends in selected threats to migratory species, their habitats and migratory routes.

(The term “threats” is used here to resonate with some other monitoring systems that could usefully be linked, and to be more readily understandable among wider audiences. The term is used here as a synonym for “pressures” in the sense that the latter is used in Target 7).

The proposed indicator does not attempt to form a global assessment of the reduction in threats to migratory species overall, but rather it will consist of a number of independent measures of specific threat types for which data are likely to be available. Delivery of any good overview will be challenging.

Consideration will need to be given to the most appropriate subdivision/classification of threat types. A degree of specificity helps to identify appropriate sources, helps with analysis and is useful for targeting policy responses. But subdividing too far risks preventing compatibility between sources that may aggregate things differently or define subject-boundaries differently, and this should be avoided.

One ingredient of this indicator will be Contracting Party National Reports to the CMS and (where applicable) CMS Family instruments. The CMS National Report Format at present asks a series of questions (divided by taxonomic group) about obstacles to migration and other perceived significant threats. Some adjustments

to these questions to achieve greater consistency would be desirable, and a rationalisation of the approach to this issue in the Format could be useful (including adding a question about change in threat status, which is currently missing and would be important for informing the indicator proposed here).

The indicator could operate as a composite indicator, composed from a variety of different sources which are each addressing some aspect of this issue, and disaggregating a specific migratory species “cut” of those where necessary.

Baseline for measurement of the indicator(s), if relevant

Data on changes (reductions) in threat level must specify the reference state with which the changed state is being compared. This will vary according to the process concerned, and as a “composite” measure, Indicator 7.1 may include comparisons that relate to a variety of different baselines (though these must always be specified).

Indicator factsheet for Target 8

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 8: The conservation status of all migratory species, especially threatened species, has considerably improved throughout their range.

Note: Actions towards this SPMS target may also contribute to SPMS target 11.

Corresponding Aichi target(s), where applicable

Target 12: By 2020 the extinction of known threatened species has been prevented and their conservation status, particularly of those most in decline, has been improved and sustained.

SPMS Goal to which the target relates

Goal 3: Improve the conservation status of migratory species and the ecological connectivity and resilience of their habitats.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

This target expects a change (“considerable improvement”) in ecological outcomes, and it is not concerned with the reasons for this change. It can therefore be measured simply and directly by monitoring the status of species.

An improvement in part of the range of a species is not sufficient to satisfy the target, since it expects the improvement to be “throughout their range”. A small improvement is also not sufficient, since it must be “considerable”, although this term has not been defined and is open to interpretation.

In a CMS context, improvement in conservation status should mean moving closer to the state of “favourable conservation status” as defined by the Convention; which involves parameters concerning population dynamics, range, habitat sufficiency, distribution and abundance.

Another cruder but simpler measure used in some other contexts is based instead on categorical shifts between the IUCN “Red List” population-based extinction risk categories (“extinct in the wild”, “critically endangered”, “endangered”, “vulnerable”, “near threatened” and “least concern”).

Target 8 expects the “considerable improvement” result to be visible for *all* migratory species. Full measurement of this may not be very practical to achieve, since not every migratory species is monitored in a way that would give a basis for the judgement, and also some species are in such a favourable status at the outset that “considerable improvement” for them is not necessary or possible. The

target's emphasis on "especially threatened species" therefore indicates a way of focusing on the most important priorities.

Definition and description: what kind(s) of indicator(s) could address this?

The first three indicators here are proposed as seemingly feasible disaggregations of existing indicators that are currently in operation. The fourth is a suggestion for an additional measure that could be developed with further work.

Reporting on these indicators should be designed to cross-refer specifically (where appropriate) to the CMS Appendices and/or Appendices in CMS daughter instruments.

8.1 Red List Index for migratory species.

The Red List Index measures the overall rate at which species move through the Red List categories described in the previous section above. The proposal here is to extract and assess separately only those species that are migratory. The Index has a number of methodological and interpretation challenges, but it also has wide currency, so it is a logical measure to use, provided careful qualifications and caveats are given that are specific to the context.

8.2 Living Planet Index for migratory species.

The Living Planet Index uses time-series data on more than 10,000 populations of over 3,000 species of mammals, birds, reptiles, amphibians and fish to measure trends in the size of the populations and to show aggregated changes as an index relative to a baseline year. The proposal here is to extract and assess separately only those species that are migratory (or particular sub-sets of these, eg CMS Appendix-listed species).

8.3 Wild Bird Index for migratory birds.

This Wild Bird Index measures average population trends of a representative suite of wild birds. Its current use includes assessments for different geographic areas and different habitat types: the proposal here is to use it in that same way, but to extract and assess only those species that are migratory.

8.4 Trends in distribution of migratory species.

This is a provisional proposal to be explored, and although ambitious it is important because the CMS puts particular emphasis on distribution (ie not only numbers) in its concept of conservation status, and because of the reference to "throughout their range" in Target 8. Graduated measurement of this for most species will be difficult; but a crude index to begin with might be built on a basis of changes in occurrences in particular geographical sub-units. It may not show much in the way of change at large geographical scales (eg the CMS Range State List), but where occurrence data at smaller scales can be gathered, this could make a useful contribution.

Occasional specific one off studies (eg on changing migratory ranges in response to climate change) may form part of the reporting associated with this indicator.

Baseline for measurement of the indicator(s), if relevant

Each of the indices above has its own approach to definition of baselines, in most cases being the starting-point from which a data time-series of the kind required can be consistently developed. Interpretation of this in many cases requires care, since often an index is composed by aggregating different datasets which each have different timeframes.

---- SPMS indicator factsheets ----

Indicator factsheet for Target 9

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 9: International and regional action and cooperation between States for the conservation and effective management of migratory species fully reflects a migration systems approach, in which all States sharing responsibility for the species concerned engage in such actions in a concerted way.

Note: The Convention on Migratory Species, being “concerned particularly with those species of wild animals that migrate across or outside national jurisdictional boundaries”, emphasizes that “conservation and effective management of migratory species of wild animals require the concerted action of all States within the national jurisdictional boundaries of which such species spend any part of their life cycle”. This would include the necessary capacity building as a key component of trans-boundary cooperation. Target 9 seeks more complete engagement by all of the States who share joint responsibility in such circumstances.

Corresponding Aichi target(s), where applicable

(No link to Aichi Targets)

SPMS Goal to which the target relates

Goal 3: Improve the conservation status of migratory species and the ecological connectivity and resilience of their habitats.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

As amplified by the “note” adopted with this target, the change it seeks is a more complete level of engagement by relevant States in the actions described, compared to the levels of engagement existing at the time of the adoption of the Strategic Plan. It may not be necessary to quantify these existing levels however, because the target also expresses a completed end-state, namely *all* the States sharing responsibilities in the circumstances described should be engaging “in a concerted way”. It is implied that some improvement over current conditions is necessary in order to reach this state. Thus even if a comparison with the baseline condition cannot be made, a comparison with this end-state (the “distance to target”) can be assessed.

Assessing the achievement of this target will require information on the following aspects:

- Individual instances of international and regional action and cooperation between States for the conservation and effective management of migratory species need to be identified.
- All States sharing responsibility for the species concerned need to be identified.

- The individual instances of action and cooperation referred to above need to be assessed to evaluate the extent to which they fully reflect a migration systems approach, with all the relevant States engaging in a concerted way.

Some interpretation may be needed as to what it means to “engage in a concerted way”. There may also be other additional elements of the judgment about “fully reflecting a migration systems approach” which need further elaboration.

Definition and description: what kind(s) of indicator(s) could address this?

9.1 Single assessment study of concerted engagements reflecting a migration systems approach.

It may be worthwhile to undertake a single assessment, during the Strategic Plan period, of the issues covered by this target. Such a study might be designed in a way that could make it repeatable on another future occasion, but the realistic interval for doing so would probably be too long for this to be regarded as regularly-reporting indicator of changes. Instead it would serve as a more discursive assessment of progress in achieving the target.

9.2 CMS National Report Format question.

The other most realistic way of monitoring this target is probably to ask CMS Party Governments to report on steps they may have taken (or activities in which they have participated) which in their opinion represent meaningful progress in the desired direction.

Baseline for measurement of the indicator(s), if relevant

The assumed baseline against which to judge the improvement which this target (as amplified by the accompanying “note”) seeks is the status of the issues concerned at the end of 2014. As argued above however, it may be possible to make the judgement as a series of “distance to target” assessments instead, which would avoid the need for data on pre-existing levels of engagement etc.

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 10: All critical habitats and sites for migratory species are identified and included in area-based conservation measures so as to maintain their quality, integrity, resilience and functioning in accordance with the implementation of Aichi Target 11, supported where necessary by environmentally sensitive land-use planning and landscape management on a wider scale.

Corresponding Aichi target(s), where applicable

Target 5: By 2020, the rate of loss of all natural habitats, including forests, is at least halved and where feasible brought close to zero, and degradation and fragmentation is significantly reduced.

Target 11: By 2020, at least 17 per cent of terrestrial and inland water, and 10 per cent of coastal and marine areas, especially areas of particular importance for biodiversity and ecosystem services, are conserved through effectively and equitably managed, ecologically representative and well connected systems of protected areas and other effective area-based conservation measures, and integrated into the wider landscapes and seascapes.

SPMS Goal to which the target relates

Goal 3: Improve the conservation status of migratory species and the ecological connectivity and resilience of their habitats.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

This target does not expressly describe a change, but it defines an intended end-state which clearly does not yet exist - at least in respect of the element specifying 100% coverage (“all” critical habitats and sites for migratory species being covered by the measures described). That change is therefore implied.

Assessment of progress towards this target would require information on:

- A shared interpretation of the term “critical” (see comment below).
- The location of all critical habitats and sites for migratory species.
- Identification of relevant area-based conservation measures that either are currently or are capable of:
 - maintaining the quality of the habitats and sites;
 - maintaining the integrity of the habitats and sites;
 - maintaining the resilience of the habitats and sites;
 - maintaining the functioning of the habitats and sites;
 - doing all of the above in accordance with Aichi Target 11, which additionally seeks

- effective management;
 - equitable management;
 - ecological representativity;
 - good connectivity;
 - integration into wider landscapes and seascapes.
- The extent to which the critical habitats and sites referred to above are included in area-based conservation measures that meet the requirements listed above.
 - Identification of situations among those identified above which require to be supported by environmentally sensitive land-use planning and landscape management on a wider scale.
 - The extent to which the situations identified in accordance with the preceding point are actually being supported in the way described.

It would be possible to interpret the term “critical” as relating for example to a single stopover site on a migratory route that is used by an entire population of migratory animals at a stage in their migratory cycle, such that jeopardising this one site jeopardises the entire population in a way that jeopardising other sites used by only a proportion of the population at other times would not do. Such circumstances are not documented with certainty for many migratory species, and such an interpretation would be likely to restrict unduly the application of this target. It is accordingly proposed to interpret the term “critical” as though it referred to standards of “significance” or “importance” commonly used for example in protected area selection criteria. Its exact meaning will therefore vary according to the particular system of area-based measures being considered at the time, and according to the scale of evaluation (national, regional, global, etc).

Clearly this is a complex target with several component parts. Although full achievement of it can consist only of full realisation of all these parts, in practice assessments of progress are likely to need to concentrate on certain particularly tractable subdivisions of the issue.

Definition and description: what kind(s) of indicator(s) could address this?

In line with the comment in the preceding section above, the indicators proposed here can only touch upon samples of the multi-stranded picture described by the target. Several of the other strands (eg resilience, equitability, connectivity) are important subjects for further work, but are not readily amenable to measurement with indicators in the near future.

10.1 Proportion of threatened and/or congregatory migratory species for which Key Biodiversity Areas have been identified throughout their range.

The benefit of this indicator will be as a prompt to essential action as well as a yardstick of measurement. The “proportion” may be assessed in terms of separate proportions for separate species groups (or geographical areas) where it is possible to know the total number (since this number may not always be known, eg in the case of invertebrates). Indicator 10.1 may therefore be implemented as a series of sub-indicators. The indicator will require a migratory species “cut” of existing inventories of Key Biodiversity Areas².

² KBAs encompass Important Bird Areas (IBAs), Alliance for Zero Extinction (AZE) sites and KBAs identified through the hotspot ecosystem profiles of the Critical Ecosystem Partnership Fund.

10.2 Proportion of Key Biodiversity Areas for selected groups of migratory species that are included in area-based conservation measures.

There are existing indicators and projects which have addressed this question for other aspects of biodiversity, and the proposal here is to develop a method that draws on those experiences and focuses on migratory species. It is likely that it will be operable for certain taxonomic groups of migratory species for which the information can be available, and hence, like Indicator 10.1, it may be implemented as a series of sub-indicators. It will operate as a migratory species “cut” of the equivalent indicator used for Aichi Target 11. Key Biodiversity Areas are interpreted in the same way as for indicator 10.1.

The migratory species groups for which the information is available will consist of those providing the answer to Indicator 10.1. Those species groups for which all their KBAs are known, can have those lists of sites (ie their mapped locations) compared with lists of relevant area-based conservation measures (eg, but not only, the locations of relevant protected areas). The function of this indicator is partly to show variations from one time period another, but mainly to assess the distance remaining to achievement of the target.

10.3 Management effectiveness of areas protected specifically for migratory species.

Indicators of protected area management effectiveness are in existing use, and the intention here is to separate out a migratory species storyline from assessment work of this kind. It might be possible to do this by extracting effectiveness tracking tool data that relates to questions of particular relevance to migratory species, but that could be problematic. A simpler way is probably to restrict this to situations where protected areas have been explicitly designated for migratory species interests (ie where such interests are explicit in the selection criteria) or where the area’s importance for these interests is otherwise formally expressed (eg by inclusion in a flyway network or similar).

Baseline for measurement of the indicator(s), if relevant

Indicators 10.1 and 10.2 are measuring proportions of a total, and Indicator 10.3 is measuring scores against a scoring framework; so they are all independent of any other baseline.

3. Relevant existing measures in CMS and other processes

Relevant targets/monitoring/indicators established in existing CMS programmes of work

Central Asian Flyway Action Plan for the Conservation of Migratory Waterbirds and their Habitats

3.2.5 Range States shall increase the capacity of local agencies and interest groups to support development and implementation of management plans of all internationally and nationally important sites to conserve the important sites for the populations listed in Table 2. These plans shall be developed in cooperation with authorities, non-government organizations and local communities.

3. Does the conservation of migratory species currently feature in any other national or regional policies/plans (apart from CMS Agreements)
 - 3.1. If Yes, please provide details:
 - 3a. Do these policies/plans cover the following areas?
 - Designation and development of protected areas
 - If Yes, please provide details
 - Development of ecological networks
 - If Yes, please provide details
 4. Results - please describe the positive outcomes of any actions taken.

V. Protected Areas

1. Are migratory species taken into account in the selection, establishment and management of protected areas in your country?
 - If Yes, please provide details:
 - 1a. Please identify the most important national sites for migratory species and their protection status:
 - 1b. Do these protected areas cover the following areas?
 - Terrestrial
 - If Yes, please provide details and include the amount of protected areas coverage and the number of protected areas
 - Aquatic
 - If Yes, please provide details and include the amount of protected areas coverage and the number of protected areas
 - Marine
 - If Yes, please provide details and include the amount of protected areas coverage and the number of protected areas
 2. Results - please describe the positive outcomes of any actions taken

Options for collecting data through new/revised questions in a future CMS National Report format

Questions proposed in Standing Committee document UNEP/CMS/StC45/Doc.14, November 2016:

10.1 Have all critical habitats and sites for migratory species been identified in your country?

If not, which are the ecosystem types, taxonomic groups and/or geographical areas for which critical habitats and sites are:

- (a) most well documented;
- (b) least well documented?

10.2 Please provide details of the number and extent of protected areas that are judged to be important for migratory species in your country:

- (a) Total number of relevant protected areas.
- (b) Total area of relevant protected areas (sq km).
- (c) Comments on how “importance for migratory species” has been interpreted in answering this question.

10.3 In respect of protected areas in your country that are important for migratory species, are any assessments of management effectiveness undertaken?

If yes, please give details.

10.4 Are other area-based conservation measures (apart from protected areas) implemented in your country in ways which benefit migratory species?

If yes, please give details.

10.5 Have actions been undertaken in your country to implement specific provisions in CMS COP Resolutions 10.3 and/or 11.25 on ecological networks for migratory species?

If yes, please give details.

---- SPMS indicator factsheets ----

Indicator factsheet for Target 11

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 11: Migratory species and their habitats which provide important ecosystem services are maintained at or restored to favourable conservation status, taking into account the needs of women, indigenous and local communities, and the poor and vulnerable.

Note: The services concerned may include water supply, quality and regulation; disaster risk reduction; climate regulation; cultural services; food and other socio-economic benefits, all contributing to people’s health, livelihoods and well-being. Actions towards this SPMS target may also contribute to SPMS target 8.

Note added subsequent to SPMS adoption: The phrase “indigenous and local communities” follows the terminology in the text of the Convention on Biological Diversity. At around the same time as the SPMS was being adopted by CMS, CBD COP Decision XII/12 (2014) confirmed that although the CBD was deciding to use the phrase “indigenous peoples and local communities” in future decisions and secondary documents, this would not act to interpret or change the legal meaning of the original phrase in the Convention text.

Corresponding Aichi target(s), where applicable

Target 14: By 2020, ecosystems that provide essential services, including services related to water, and contribute to health, livelihoods and well-being, are restored and safeguarded, taking into account the needs of women, indigenous and local communities, and the poor and vulnerable.

Target 15: By 2020, ecosystem resilience and the contribution of biodiversity to carbon stocks has been enhanced, through conservation and restoration, thereby contributing to climate change mitigation and adaptation and to combating desertification.

SPMS Goal to which the target relates

Goal 4: Enhance the benefits to all from the favourable conservation status of migratory species.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

Target 8, although formulated differently, effectively has the same objective of seeking favourable conservation status for migratory species. Target 11 may be regarded as a sub-target of that target, since it seeks the same outcome for a subset of migratory species, namely those which provide important ecosystem services.

Target 11 could be read as containing two parallel expectations, one relating to the status of species that provide important services, and one relating to the status of habitats that provide important services. For assessment purposes however it will be more practical to regard this as primarily a species-focused question, where it is the *ecological system of a species in its habitat* that (in combination) gives rise to the services, and the *status of the species in this context* is the issue to be assessed.

Assessment of progress towards this target will require information on:

- Identification of particular species (and species-habitat interactions) that provide important ecosystem services (including identification of the services concerned).
- Conservation status of the species concerned, assessed by reference to the definition of “favourable conservation status” adopted by the CMS.
- The relevant needs of women, indigenous and local communities and the poor and vulnerable.
- Whether (and ideally how) the needs of women and the other groups mentioned in the preceding point have been taken into account.

Definition and description: what kind(s) of indicator(s) could address this?

11.1 “Case study” approach.

Measuring ecosystem service delivery by itself will not be enough to assess achievement of this target. Measuring species status by itself will also not be enough. The storyline at stake here is about the relationship between the two, and this may be best evaluated by means of narrative rather than by statistical data. Although not strictly an “indicator”, a series of case studies is proposed. They would each follow a standard template, with obligatory sections on species/habitat-service relationships, conservation status trends, service delivery trends, addressing the needs of women/indigenous and local communities/the poor and vulnerable, and lessons learned.

It would be preferable to select cases which involve ecosystem services other than direct consumptive use, since the latter is covered under other targets (see Targets 5, 6, 14). Services such as pollination or grazing-related aspects would therefore be more of a priority. Moderation of case selection would be necessary to avoid too much bias, for example in reporting only the greatest success stories.

Baseline for measurement of the indicator(s), if relevant

Each case study should define its own baseline.

Indicator factsheet for Target 12

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 12: The genetic diversity of wild populations of migratory species is safeguarded, and strategies have been developed and implemented for minimizing genetic erosion.

Note: Safeguarding actions may include maintenance of the original gene pool for migratory species that are managed under human care for re-introduction into the wild and other purposes, or are otherwise of socio-economic as well as cultural value.

Corresponding Aichi target(s), where applicable

Target 13: By 2020, the genetic diversity of cultivated plants and farmed and domesticated animals and of wild relatives, is maintained, and strategies have been developed and implemented for minimizing genetic erosion and safeguarding their genetic diversity.

SPMS Goal to which the target relates

Goal 4: Enhance the benefits to all from the favourable conservation status of migratory species.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

This target foresees three distinct results:

- Strategies for minimizing genetic erosion are developed.
- The strategies mentioned above are implemented.
- The genetic diversity of the populations referred to is safeguarded.

The first two of these involve measurable process activities. The third is framed in terms of preventing loss rather than achieving gain. Success with this third (outcome) result will therefore be marked by evidence of an *absence* of change rather than by evidence of a change.

The target is worded in an all-embracing way, suggesting that success requires an absence of *any* loss of genetic diversity among *any* wild population of *any* migratory species anywhere in the world. In fact the intention is to operate it more narrowly than this, in the specific context of Aichi Target 13. Aichi Target 13 is concerned with particular taxa which have productive uses for people, and SPMS Target 12 should be interpreted as referring to wild populations (or relatives) of species that also exist in captive-bred or domesticated populations. (Conservation in general of all migratory species is covered instead by Target 8).

Definition and description: what kind(s) of indicator(s) could address this?*12.1 CMS National Report Format question, in two parts.*

Existing indicators are not well suited to addressing genetic erosion in wild animals. The most feasible course is probably to ask CMS Parties to report on *activities* that relate to this target, in response to two questions.

The first question would ask about the development of strategies for minimizing genetic erosion that are relevant to migratory species. (Limiting this to strategies addressing only migratory species might narrow the scope too strictly; hence the reference to strategies that are “of relevance” to migratory species).

The second question would ask about implementation actions, including implementation of relevant strategies where these have been mentioned in response to the first question, and including other projects or initiatives which may be contributing to the achievement of the target.

Baseline for measurement of the indicator(s), if relevant

As the proposed indicator is based simply on event (activity) recording (without attempting to assess trends), baselines do not need to be defined.

---- SPMS indicator factsheets ----

Indicator factsheet for Target 13

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 13: Priorities for effective conservation and management of migratory species, their habitats and migration systems have been included in the development and implementation of national biodiversity strategies and action plans, with reference where relevant to CMS agreements and action plans and their implementation bodies.

Note: Other types of national plans and strategies, such as those for the implementation of other Multilateral Environmental Agreements or national development plans, may also be highly relevant. Even if they are not designed overtly to have biodiversity-related purposes, plans for issues such as land use, resource use, public health, disaster risk reduction, infrastructure distribution and economic development can include provisions that make an important difference to migratory species conservation. Actions towards this SPMS target may also contribute to SPMS target 2.

Corresponding Aichi target(s), where applicable

Target 17: By 2015 each Party has developed, adopted as a policy instrument, and has commenced implementing an effective, participatory and updated national biodiversity strategy and action plan.

SPMS Goal to which the target relates

Goal 5: Enhance implementation through participatory planning, knowledge management and capacity building.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

Target 2 addresses integration of migratory species values into international, national and local strategies and planning processes of various kinds, so it should be read alongside Target 13 which seeks a similar (though not identical) result specifically in relation to the well-recognised and very widespread (currently 84 countries) National Biodiversity Strategies and Action Plans (NBSAPs). The “note” adopted with the target also allows its interpretation to be extended to cover other types of national plans and strategies that are not already covered by Target 2.

To the extent that any NBSAP does not currently include priorities for effective conservation and management of migratory species/habitats/migration systems, Target 13 expects such priorities to be added, and it expects reference to be made where relevant to CMS agreements and action plans and their implementation bodies. NBSAPs can be and are periodically revised by CBD Party Governments, so there is a ready route available for achieving this change.

The target also expects priorities for effective conservation and management of migratory species/habitats/migration systems to be included in the *implementation*

of NBSAPs, and evidencing progress with this will require different additional information.

Definition and description: what kind(s) of indicator(s) could address this?

13.1 Extent of reflection of migratory species concerns in National Biodiversity Strategies and Action Plans.

“Migratory species concerns” is shorthand for what the target refers to as “priorities for effective conservation and management of migratory species, their habitats and migration systems, including reference where relevant to CMS agreements and action plans and their implementation bodies”.

The CMS National Report Format currently asks whether migratory species are addressed by each country’s NBSAP. This is likely only to go as far as tracking the presence or absence of references to migratory species in NBSAPs. A more detailed question could be asked, but this is not really necessary because NBSAPs are available to be consulted and analysed directly. A simple framework (approximately five questions, with answers perhaps scored 1-5 plus scope for narrative comment) could be developed for assessing and reporting on this, at intervals to be decided.

“Extent” of reflection could be reported qualitatively or quantitatively (for example quantifying the proportion of countries in each score-category of the question framework mentioned above).

13.2 Extent of reflection of migratory species concerns in the implementation of National Biodiversity Strategies and Action Plans.

“Concerns” and “extent” should be interpreted as for Indicator 13.1 above. This indicator could be operated as a CMS National Report Format question, but it could equally be assessed more empirically by analysing data from the national mechanisms to monitor implementation of NBSAPs which CBD Parties have already been urged to establish, and the regular progress reports to the CBD Secretariat which they have been urged to provide (CBD COP Decision IX.8, 2008). Again a simple analysis framework such as that suggested for Indicator 13.1 above could be used.

Baseline for measurement of the indicator(s), if relevant

NBSAPs are provided for in Article 6 of the CBD and will have been initiated at different times by different countries following their accession to that Convention. The Indicators above simply seek to document the absolute status of relevant issues in plans and their implementation, without putting emphasis on comparisons or trends, so baselines are not crucial.

---- SPMS indicator factsheets ----

Indicator factsheet for Target 14

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 14: The traditional knowledge, innovations and practices of indigenous and local communities relevant for the conservation and sustainable use of migratory species, their habitats and migration systems, and their customary sustainable use of biological resources, are respected, subject to national legislation and relevant international obligations, with the full and effective participation of indigenous and local communities, thereby contributing to the favourable conservation status of migratory species and the ecological connectivity and resilience of their habitats.

Note: This target reflects international thinking on the subject in other fora.

Corresponding Aichi target(s), where applicable

Target 18: By 2020, the traditional knowledge, innovations and practices of indigenous and local communities relevant for the conservation and sustainable use of biodiversity, and their customary use of biological resources, are respected, subject to national legislation and relevant international obligations, and fully integrated and reflected in the implementation of the Convention with the full and effective participation of indigenous and local communities, at all relevant levels.

SPMS Goal to which the target relates

Goal 5: Enhance implementation through participatory planning, knowledge management and capacity building.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

This target describes a state which may already exist in some places and may not in others, hence in the latter case a change would be expected in order to achieve it.

Assessing this in either case will require information on:

- The traditional knowledge, innovations and practices of indigenous and local communities that are relevant for the conservation and sustainable use of migratory species, their habitats and migration systems.
- The customary sustainable use of biological resources of indigenous and local communities (presumably as far as this is also relevant to the same purposes as mentioned above, although that is not stated).
- The extent to which the knowledge, innovations, practices and customary uses described above are being respected, subject to relevant legislation and obligations.
- The extent to which indigenous and local communities are fully and effectively participating in the way that the matters listed above are being respected.

It appears to be *assumed* that contributions to “the favourable conservation status of migratory species and the ecological connectivity and resilience of their habitats” will follow as an *automatic consequence* of achieving the “respect” described in the target. It should therefore not be necessary in the context of this target to assess these ecological outcomes in their own right (they are in any case covered by other targets in the Plan), nor to attempt to assess the way in which this causative relationship functions. Achievement of the target therefore can be judged by evidence of the defined forms of (i) respect and (ii) participation.

Definition and description: what kind(s) of indicator(s) could address this?

14.1 CMS National Report Format question.

Parties would be invited to provide a narrative comment on the extent to which they have achieved this target, in their own context. They would need to respond to each of the two distinct parts of the expectation, namely (i) respect and (ii) participation, and in addition to a comment, they could be asked to score their own assessment of achievement on a scale of 1 (poor) to 5 (good).

The extent to which Target 14 is relevant will vary from country to country (some will have more indigenous and local communities, and/or more traditional knowledge, innovations and practices, and/or more customary sustainable uses, than others) - but it is likely that in nearly every case a country should be able to report at least something in relation to these issues. This can of course include information on how they have contributed to the achievement of the target elsewhere, in a context of international cooperation.

In answering this question Parties will be able to draw on information relating to implementation of Aichi Target 18 and the associated Programme of Work, Plan of Action and Guidance on relevant provisions in the CBD (Articles 8(j), 10(c) and related provisions), provided they give specific consideration to the migratory species aspects of this.

Baseline for measurement of the indicator(s), if relevant

The default baseline for any assessment of progress and trends will be the status of these matters as at the end of 2014.

3. Relevant existing measures in CMS and other processes

Indicator factsheet for Target 15

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 15: The science base, information, training, awareness, understanding and technologies relating to migratory species, their habitats and migration systems, their value, functioning, status and trends, and the consequences of their loss, are improved, widely shared and transferred, and effectively applied.

Note: The “science base” here does not relate only to new research and monitoring, but also to making better use of existing datasets (including improving their public availability), and improving the standardization of data collection protocols. In addition to investigation and understanding of specific events, phenomena, patterns and consequences, greater efforts may also be required to improve data on baseline conditions, so that meaningful assessments of significance, and assessments of change, can be made.

Corresponding Aichi target(s), where applicable

Target 19: By 2020, knowledge, the science base and technologies relating to biodiversity, its values, functioning, status and trends, and the consequences of its loss, are improved, widely shared and transferred, and applied.

SPMS Goal to which the target relates

Goal 5: Enhance implementation through participatory planning, knowledge management and capacity building.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

This target addresses a list of different aspects of knowledge and capacity, and in relation to all of these collectively it expects three kinds of result:

- The listed aspects should be “improved”.
- The listed aspects should be widely shared and transferred.
- The listed aspects should be effectively applied.

The first of these is an explicit expression of an expected change relative to the starting position. The “note” adopted with the target makes reference to standardization of data collection protocols and to making baseline data more useful for assessing significance and change, but in all other respects the term “improved” is not defined and is left open to interpretation.

The aspect of “awareness” is addressed also by Target 1.

Definition and description: what kind(s) of indicator(s) could address this?*15.1 Trends in publication of papers on migratory species conservation in peer-reviewed sources.*

This indicator addresses only one aspect of the target, as merely a sample of the issues it covers. It concentrates particularly on the “science base” dimension, and does not attempt to assess the “effective application” part of the target (which would be difficult).

A method of globally measuring this indicator requires development. The CMS National Report Format currently contains questions about numbers of research projects, in respect of each taxonomic group. It also contains questions about research projects that use satellite telemetry. Responses to these questions may play some role in supporting assessment of Target 15, but they are likely to be very incomplete (and to be prone to some duplication between Parties), so National Reports are *not* seen as a prime source for this indicator.

A more promising avenue probably lies instead with structured searches of on-line libraries, databases and other web-based sources, in a chosen list of widely-used languages. Search protocols and key words would be carefully defined in order to filter for materials of relevance to migratory species, their habitats and migration systems. Document-download statistics might also be analysed to give some perspective on the “sharing and transferring” part of the target.

Individual pilot sample studies of the processes described above may need to suffice in providing some intelligence on this matter until such time as a functioning indicator is developed.

Baseline for measurement of the indicator(s), if relevant

The baseline would be set by the coming into operation of the indicator, once developed. Any prior pilot studies as described above would be likely to be one-off events, and hence the question of baselines in such cases would probably not apply.

3. Relevant existing measures in CMS and other processes**Relevant targets/monitoring/indicators established in existing CMS programmes of work***Central Asian Flyway Action Plan for the Conservation of Migratory Waterbirds and their Habitats*

4.1.9. Range States shall promote the education and training of hunters for the conservation and sustainable use of waterbirds, including through hunting associations and shall endeavour to make mandatory hunter proficiency tests as a condition for the issue of hunting licences. The proficiency test for hunters should include, among other things, waterbird identification including of target and non-target species

4.6.1. Range States shall, where necessary, arrange for training programmes to ensure that personnel responsible for implementing this Action Plan have adequate knowledge to implement it effectively.

4.6.2. Range States shall cooperate with each other and international organizations in order to develop and arrange new appropriate training programmes for national officials, stakeholders and experts on waterbird and habitat monitoring, protection and management.

4.6.4. Range States shall cooperate with each other (bilaterally, multilaterally and regionally) and the Secretariat with a view to exchanging resource materials and developing training programmes.

5.8 The Secretariat shall endeavour to initiate bilateral, regional and flyway scale training, education and public awareness activities.

Relevant questions in the existing CMS National Report format

VI. Policies on Satellite Telemetry

1. In the current reporting period, has your country undertaken conservation/research projects that use satellite telemetry?
If yes what is the state of those projects?
Please provide details.
2. Are any future conservation/research projects planned that will use satellite telemetry?
If Yes, please provide details (including the expected timeframe for these projects):
3. Results - please describe the positive outcomes of any actions taken.

IX. Mobilization of Resources

4. Has your country provided technical and/or scientific assistance to developing countries to facilitate initiatives for the benefit of migratory species?
If Yes, please provide details (Indicate the migratory species that have benefited from these activities).

X. Implementation of COP Resolutions and Recommendations

Please provide information about measures undertaken by your country relating to recent Resolutions and Recommendations since the last Report. For your convenience please refer to the list of COP Resolutions and Recommendations listed below:

Resolutions [*include*]:

CMS Information Priorities (9.3) [*Also under Target 1*].

Capacity Building Strategy (9.12 / 10.6) [*Also under Targets 14 and 16*].

Options for collecting data through new/revised questions in a future CMS National Report format

Questions proposed in Standing Committee document UNEP/CMS/StC45/Doc.14, November 2016:

15.1 In the current reporting period, which steps taken in your country have contributed to the achievement of the results defined in Target 15 of the Strategic Plan for Migratory Species (*The science base, information, training, awareness, understanding and technologies relating to migratory species, their habitats and migration systems, their value, functioning, status and trends, and the consequences of their loss, are improved, widely shared and transferred, and effectively applied*)?

(a) Please give details.

(b) Please comment in particular (where applicable) on aspects relating to:

- Training;
- Sharing and transfer of information and technologies;
- Improving the science base;
- Effective application of improved understanding.

---- SPMS indicator factsheets ----

Indicator factsheet for Target 16

1. Introduction

Text of the target (with “note” as adopted in SPMS)

Target 16: The mobilization of adequate resources from all sources to implement the Strategic Plan for Migratory Species effectively has increased substantially.

Note: This target refers to resource mobilization in the broad sense including international and domestic funding from public, private and other sources. It however also implies policy choices that reduce the costs of improving the status of migratory species and thus also benefits from the correct implementation of Goals 1 and 2. Developing countries, least developed countries, small island developing states and countries with economies in transition have particularly acute needs in this regard. Resource flows to as well as within these countries need to increase, both through “north-south” and “south-south” cooperation.

Corresponding Aichi target(s), where applicable

Target 20: By 2020, at the latest, the mobilization of financial resources for effectively implementing the Strategic Plan for Biodiversity 2011-2020 from all sources, and in accordance with the consolidated and agreed process in the Strategy for Resource Mobilization, should increase substantially from the current levels.

Links to the CBD Resource Mobilization Strategy (COP9/11§7) and the resource mobilization target (COPXI/4): “Double total biodiversity-related international financial resource flows to developing countries, in particular least developed countries and small island developing States, as well as countries with economies in transition, by 2015 and at least maintaining this level until 2020, in accordance with Article 20 of the Convention, to contribute to the achievement of the Convention’s three objectives, including through a country-driven prioritization of biodiversity within development plans in recipient countries, using the preliminary baseline referred to in paragraph 6”.

SPMS Goal to which the target relates

Goal 5: Enhance implementation through participatory planning, knowledge management and capacity building.

2. Proposed indicator(s)

Objective: what is the expected result that needs to be assessed?

Achievement of this target will involve a measurable positive difference in mobilisation of resources between a baseline point and (a) subsequent assessment point(s). The resources may be financial or they may be of other kinds (eg human capacity), but they must contribute to SPMS implementation. Furthermore, to satisfy the target, the increase which occurs must be “substantial” (although what this means is not quantified in the target).

Definition and description: what kind(s) of indicator(s) could address this?

Much discussion has occurred on potential measures of resource-flows in ways which would provide an indication of progress toward achievement of the equivalent Aichi Target (20). The methodological challenges are considerable - not least the question of establishing the position at a relevant baseline from which to measure change. Attempting to isolate a migratory species story from this adds a further major challenge.

More selective options might lie with targeted analyses of relevant spending by the GEF, or resource mobilisation for implementation of NBSAPs, or quantifying the resources (of all kinds) involved in projects that address (or that indirectly benefit) migratory species. Accuracy of quantification is not important - what is important is to be able to compare measures made in a consistent way between one time-period and another.

For the time being, at the global “synthesis” level, Indicator 16.1 defines a somewhat simpler concept.

16.1 Success in implementing national actions for mobilising resources to meet Target 16.

This suggestion is based on a presupposition that governments will each be encouraged to define some specific national resource mobilisation actions for migratory species conservation. The global indicator would then assess the impact of these actions, drawing where appropriate on monitoring undertaken in the context of reporting to the CBD on Aichi Target 20.

It would be for each country to define the national resource mobilisation targets and monitoring methods that it deems applicable to its own circumstances, and it would then be asked to evaluate progress in achieving its own targets, by some method (for example a percentage score) that would enable global aggregation and comparison from one time to another. The common stipulations would be:

- Actions should be framed so as to be explicitly serving SPMS Target 16 (ie their scope should match the scope of the SPMS, and their scale of ambition should match the aim of “substantial increase” defined in Target 16).
- Flows included should be identifiably related to migratory species conservation purposes (this could allow the actions to be quite narrowly focused on a few key programmes).
- Non-financial resources as well as financial resources should be covered.
- Relevant international flows into/from the country should be covered as well as relevant domestic flows.
- Provision should be made for monitoring in a consistent way from one time-period to another.

Baseline for measurement of the indicator(s), if relevant

Any national actions developed as suggested above will have a variety of different start-dates and durations. Target 16 however expects ultimately to see evidence of a “substantial increase” between the time of adoption of the SPMS (end of 2014) and the end of the Plan period (2023). Hence efforts should be made to quantify availability of resources as well as existing national actions/targets at the end of 2014, in order to provide the appropriate reference baseline.
