It includes activities – monitoring of eagles population, creating a protected zone around each active nest to eliminate disturbance. The population was watched year by year, in the nest the chicks were ringed, micro chipped and blood samples were taken. As nest robbery is affecting breeding success markedly, the most endangered pairs were guarded. Satellite and radio telemetry have been used for the protection of birds of prey for the first time in Slovak history, with the aim to get data about eagles occurrence, their migration routes and habitat preferences. Other activity was focused on evaluation of habitat quality in relation to land-use practices. Artificial nests have been installed and natural nests have been reconstructed where needed. The mortality of birds was regularly monitored along dangerous power lines during the whole project, deterrents and barriers were designed to prevent the electrocution of the birds were installed at the most dangerous power lines. The capture and reintroduction of suslik as food source has been implemented on suitable sites. During the entire project special attention was given to the public awareness and dissemination of the project's aims and results.

This project is focused on habitat conservation measures in two sites identified as Special Protection Areas under the Birds Directive. Project includes elaboration of strategic documents namely management plans for Syslovske polia and Lehnice SPAs, agri-environmental scheme for <i>Otis tarda</i> , strategies for farmers and hunters to reduce mortality and avoid disturbance. Within the project a value is added to all the strategic documents by implementation of practical activities fulfilling the strategies. In relation to the strategies for farmers and hunters, agricultural measures will be taken to improve accessibility of food in winter to reduce starvation and hunting restrictions will be made to prevent hunting in breeding season and to control predators to reduce mortality of individuals. The agri-

	environmental scheme will be implemented and tested within the project to provide a cost-effective incentive for farmers to apply the proper land use techniques. To ensure maintaining of favourable habitat conditions in the most effective way, the land in core parts of SPAs will be purchased/leased and the grasslands providing suitable feeding basis and breeding sites will be restored. To ensure proper long-term agricultural utilization of the sites, the equipment for land management will be purchased. In the areas which can not be converted into grasslands or which are private, suitable crop structure and proper agricultural techniques will be negotiated and implemented by land users. Windbreaks at the target localities will be restored with regards to <i>Otis tarda</i> requirements and with respect to biological needs of other SPA qualifying species. Warning marks and insulators will be installed on power lines in SPA Lehnice to prevent mortality resulting from the collision. To avoid disturbance and to improve local public attitude to the target species, infrastructure improving protection of sites and their accessibility to public will be installed.

## Annex: Updating Data on Appendix II Species

The tables below contain the list of all species listed in Appendix II.

New Parties which have acceded since COP8 in 2005 and Parties which did not submit a National Report in 2005 are requested to complete the entire form.

Parties that did submit a report in 2005 need only which information has changed (e.g. new published distribution references and details concerning species added to Appendix II at COP8).
