

**CONVENTION ON
MIGRATORY
SPECIES**

UNEP/CMS/COP14/Inf.27.7.2

30 January 2024

Original: English

14th MEETING OF THE CONFERENCE OF THE PARTIES

Samarkand, Uzbekistan, 12 – 17 February 2024

Agenda Item 27.7.2

FRESHWATER FISHES OF POTENTIAL INTEREST FOR INCLUSION IN CMS

(Prepared by IUCN et al.)

Briefing document for the Fourteenth Meeting of the Conference of the Parties to the Convention on the Conservation of Migratory Species of Wild Animals (CMS COP14)

Freshwater fishes of potential interest for inclusion in CMS

Prepared in January 2024

Authored by: Catherine Sayer (IUCN)¹, Kathy Hughes (IUCN Species Survival Commission; WWF), Brian Zimmerman (IUCN Species Survival Commission), and Guillermo Estupiñán (Wildlife Conservation Society).

Reviewed by: Zeb Hogan (IUCN Species Survival Commission; University of Nevada, Reno), Susan Lieberman (Wildlife Conservation Society), Ian Harrison (IUCN Species Survival Commission), Michele Thieme (IUCN Species Survival Commission; WWF), and Richard Jenkins (IUCN).

Background

Migratory freshwater fishes play key roles in ecosystem functioning, support the economy and livelihoods of millions of people worldwide, and have cultural importance to numerous communities. Conservation of these species and the freshwater habitats they require is, therefore, vital in terms of both their biological and socioeconomic value². However, globally migratory freshwater fish populations declined by an average of 76% between 1970 and 2016³. At present, migratory freshwater fishes are generally overlooked by current policy mechanisms, with only a few species listed on the CMS Appendices⁴.

The aim of this briefing document is to use the recently published global freshwater fish assessment from The IUCN Red List of Threatened Species™ (hereafter “IUCN Red List”)⁵ to highlight freshwater fishes of potential interest for inclusion in CMS and identify patterns in taxonomy, geography, and threat processes amongst the highlighted species.

⁵ The IUCN Red List of Threatened Species™ (<https://www.iucnredlist.org>) is made possible through the active participation of the Red List Partnership (<https://www.iucnredlist.org/about/partners>).

Methods

This analysis is based on data from version 2023-1 of the IUCN Red List⁶.

1. Defining freshwater fishes

Fishes were defined based on species in the classes Actinopterygii, Chondrichthyes, Myxini, Petromyzonti, or Sarcopterygii. Fish taxonomy on the IUCN Red List largely follows that of Eschmeyer's Catalog of Fishes⁷, but there are some discrepancies, primarily based on advice from the IUCN Species Survival Commission or due to taxonomic changes over time that have not yet been captured on the IUCN Red List.

Freshwater species were then defined based on those in the 'Freshwater (=Inland waters)' system. This resulted in a list of 14,898 freshwater fishes.

Caveats: As of December 2023, freshwater fishes are considered a comprehensively assessed group on the IUCN Red List because 80% of formally described species have a published Red List assessment. However, it should be noted that 20% of freshwater fishes still require assessment and will therefore not be considered in this analysis. It is recommended that this analysis is repeated as the coverage of freshwater fishes on the IUCN Red List increases.

2. Defining migratory freshwater fishes

Migratory freshwater fishes were then identified from the above 14,898 species based on those with movement patterns of 'Altitudinal Migrant', 'Full Migrant', or 'Nomadic'. This resulted in a list of 1,183 migratory freshwater fishes.

The above movement patterns are defined as follows:

- **Nomadic** - moves in response to resources that are sporadic in time and distribution. Examples include Golden-plumed Parakeet (*Leptosittaca branickii*), Palm Lorikeet (*Charmosyna palmarum*), Grey Imperial-pigeon (*Ducula pickeringii*), Addax (*Addax nasomaculatus*) and Plains Mouse (*Pseudomys australis*). Nomadic species may congregate, but not predictably in terms of location and timing (e.g., Lesser Flamingo (*Phoeniconaias minor*)). Nomadic species have evolved to move. Nomadic species usually cannot be conserved at the site scale alone.
- **Full migrant** – a substantial proportion of the global or regional population makes regular or seasonal cyclical movements beyond the breeding range, with predictable timing and destinations. Examples include Siberian Crane (*Leucogeranus leucogeranus*), Bluefin Tuna (*Thunnus* spp.), Humpback Whale (*Megaptera novaeangliae*), Sockeye Salmon (*Oncorhynchus nerka*), Lake Sturgeon (*Acipenser fulvescens*), European Eel (*Anguilla anguilla*), Mekong Giant Catfish (*Pangasianodon gigas*) and American Horseshoe Crab (*Limulus polyphemus*). This includes species that may be migratory only in part of their range (e.g. Common Wildebeest (*Connochaetes taurinus*)) or part of their population (e.g. White-starred Robin (*Pogonocichla stellata*)), short-distance migrants (e.g., Black Crowned-Crane (*Balearica pavonina*)) and migrants that occasionally may respond to unusual conditions in a semi-nomadic way (e.g. Black Honeyeater (*Sugomel nigrum*) and Common Gull-billed Tern (*Gelochelidon nilotica*)). Migratory species may require conservation action (at specific sites, or beyond sites) along migration routes.

The definitions above exclude "environmental response migrants" i.e. species that are largely resident but move opportunistically in response to irregular environmental conditions such as

⁶ IUCN 2024. The IUCN Red List of Threatened Species. Version 2023-1. <https://www.iucnredlist.org/>

⁷ <https://researcharchive.calacademy.org/research/ichthyology/catalog/fishcatmain.asp>

fire, locust eruptions, etc., “rains migrants/arid migrants” i.e. species which move with unpredictable timing and destination in response to irregular rainfall patterns, “nutrition migrants/post-roost dispersers” i.e. species that disperse daily from roosts to forage, and “post-breeding dispersers” which may not make cyclical movements i.e. dispersers that may not return to the same breeding area. All such species should not be coded as migrants or nomads.

- **Altitudinal migrant** – regularly/seasonally makes cyclical movements to higher/ lower elevations with predictable timing and destinations. Examples include Three-wattled Bellbird (*Procnias tricarunculatus*). Partial altitudinal migrants might not be best conserved at the site scale alone, if individual sites do not encompass the full altitudinal range of the species.

Caveats: It is recommended but not required to code movement patterns as part of an IUCN Red List assessment. Of the 14,898 assessed freshwater fishes, 6,823 (46%) had no movement pattern coded (i.e., this field was not completed by the Red List assessors) and 3,560 (24%) had movement pattern coded as ‘Unknown’.

Definitions of movement patterns on the IUCN Red List are applicable to all taxonomic groups and therefore, differ from the commonly used definitions for migratory fishes (e.g., anadromous, potadromous, diadromous). It is not possible to map directly between the IUCN definitions and this terminology. Therefore, we have retained the IUCN definitions in this analysis.

3. Defining transboundary species

Transboundary species were then identified from the above 1,183 species based on those coded to occur in at least two countries with presence coded as ‘Extant’ or ‘Possibly Extinct’ and origin coded as ‘Native’ or ‘Reintroduced’. This resulted in a list of 891 migratory freshwater fishes that occur in at least two countries. These species can be found in the ‘Species List’ below.

Caveats: This filter removes species that are endemic to one country. However, it is not possible to confirm that all species occurring in at least two countries also perform migrations across their borders. Migratory routes are not mapped as part of an IUCN Red List assessment.

4. Defining species of conservation concern

One way to identify species of conservation concern is based on the assigned IUCN Red List Categories, which indicate the extinction risk of the species. The breakdown of Red List Categories associated with the ‘Species List’ below are as follows:

IUCN Red List Category	Count
Extinct (EX)	0
Extinct in the Wild (EW)	0
Critically Endangered (CR)	19
Endangered (EN)	24
Vulnerable (VU)	44
Near Threatened (NT)	30
Least Concern (LC) or Lower Risk/least concern (LR/lc)	700
Data Deficient (DD)	74
Total	891

Critically Endangered (CR), Endangered (EN), and Vulnerable (VU) are the “threatened” categories and refer to species at high to extremely high risk of extinction in the wild.

Alternative ways of identifying species of conservation concern include using the current population trend (i.e., those species where the population trend is ‘Decreasing’). This information is included in the ‘Species List’ below but not further analysed here.

Results

There are 87 threatened and transboundary migratory freshwater fishes in the ‘Species List’ below, which should be considered as species of potential interest for inclusion in CMS.

Taxonomic patterns

The transboundary migratory freshwater fishes identified in the overall ‘Species List’ belong to 120 families, with greatest representation of the families Cyprinidae (carps or minnows – 157 species, 18%) and Gobiidae (gobies – 85 species, 10%).

However, when focussing on the subset of threatened species, the families with greatest representation were the Cyprinidae (carps or minnows – 26 species, 30%), Acipenseridae (sturgeons – 16 species, 18%), Salmonidae (salmonids – 7 species, 8%), Anguillidae (freshwater eels – 5 species, 6%), Clupeidae (herrings – 5 species, 6%), Pangasiidae (shark catfishes – 4 species, 5%), and Pimelodidae (long-whiskered catfishes – 4 species, 5%).

The latter family includes the two species proposed for inclusion on CMS: the gilded catfish (*Brachyplatystoma rousseauxii*) and laulao catfish (*B. vaillanti*). The Living Planet Index (LPI) for migratory freshwater fishes also indicates the Acipenseridae and Anguillidae as families facing severe declines, with 91% and 92% declines, respectively, in populations of these families between 1970 and 2016⁸.

Geographic patterns

The table below indicates the region⁹ each species in the ‘Species List’ and the subset of threatened species in the ‘Species List’ are coded to occur in. The counts add up to greater than the total number of species because species can occur in more than one region.

Region	All Species		Threatened Species		
	Count	Proportion	Count	Proportion	
Africa	North Africa	53	6%	2	2%
	Sub-Saharan Africa	197	22%	8	9%
Americas	Caribbean Islands	32	4%	2	2%
	Mesoamerica	55	6%	5	6%
	North America	63	7%	10	11%
	South America	195	22%	10	11%
Antarctica	Antarctic	1	0%	0	0%
Asia	East Asia	168	19%	18	21%
	North Asia	124	14%	22	25%
	South and Southeast Asia	321	36%	28	32%
	West and Central Asia	127	14%	28	32%

⁸ Deinet, S. et al. 2020. The Living Planet Index (LPI) for migratory freshwater fish - Technical Report. World Fish Migration Foundation, The Netherlands.

⁹ <https://www.iucnredlist.org/resources/country-codes>

Europe	Europe	76	9%	17	20%
Oceania	Oceania	100	11%	0	0%

The regions hosting the most transboundary migratory freshwater fishes are South and Southeast Asia (321 species, 36%), Sub-Saharan Africa (197 species, 22%), South America (195 species, 22%), and East Asia (168 species, 19%).

However, when focussing on the subset of threatened species, the regions hosting the most transboundary migratory freshwater fishes are South and Southeast Asia (28 species, 32%), West and Central Asia (28 species, 32%), North Asia (22 species, 25%), East Asia (18 species, 21%), and Europe (17 species, 20%).

Key threatening processes

The table below indicates the high-level threats¹⁰ each species in the ‘Species List’ and the subset of threatened species in the ‘Species List’ are coded to be facing. The counts add up to greater than the total number of species because species can be coded to face more than one threat. Additionally, some species are coded to face no threats or threats may be unknown.

Threat	All Species		Threatened Species	
	Count	Proportion	Count	Proportion
Residential & commercial development	89	10%	18	21%
Agriculture & aquaculture	143	16%	12	14%
Energy production & mining	123	14%	18	21%
Transportation & service corridors	17	2%	9	10%
Biological resource use	450	51%	71	82%
Human intrusions & disturbance	30	3%	8	9%
Natural system modifications	388	44%	73	84%
Invasive & other problematic species, genes & diseases	101	11%	28	32%
Pollution	361	41%	56	64%
Geological events	1	0%	0	0%
Climate change & severe weather	86	10%	21	24%
Other options	3	0%	2	2%

Key threats to transboundary migratory freshwater fishes are biological resource use (including small- and large-scale harvesting, and intentional and unintentional use – 450 species, 51%), natural system modifications (including dams and water extraction – 388 species, 44%), and pollution (from agricultural, domestic, and industrial sources – 361 species, 41%).

These are also the key threats to threatened transboundary migratory freshwater fishes, although affecting a higher proportion of species: natural system modifications (73 species, 84%), biological resource use (71 species, 82%), and pollution (56 species, 64%).

Demonstrating these key threats, the gilded catfish (*Brachyplatystoma rousseauxii*) is currently assessed as Vulnerable (VU) on the IUCN Red List based on a projected population decline of at least 37% over the next three generations as a result of damming on the Madeira

¹⁰ <https://www.iucnredlist.org/resources/threat-classification-scheme>

River¹¹. Globally, there has been a substantial increase in the number of dams over the past six decades¹² and now only 37% of rivers over 1,000 km remain free-flowing¹³. Dams often have major impacts on migratory fish, for example through creating barriers to migration routes, and altering flow regimes and sediment flux. The impact of damming on the gilded catfish could increase if poorly planned new developments are implemented in other river basins, especially in the Andean region. Ongoing commercial fishing of the species and pollution from mining activity are also threats to the species.

Species List

The species list below includes 891 species that meet the following criteria based on IUCN Red List data (see Methods for full details):

- Fishes, defined as species in the classes Actinopterygii, Chondrichthyes, Myxini, Petromyzonti, or Sarcopterygii
- Freshwater species, defined as those coded to the Freshwater (=Inland waters) system
- Migratory species, defined as those coded as Altitudinal Migrant, Full Migrant, or Nomadic
- Transboundary species, defined as those coded to occur in at least two countries with Extant or Possibly Extinct presence and Native or Reintroduced origin.

Threatened species are identified through colour coding as follows:

- Red background – Assessed as Critically Endangered (CR)
- Orange background – Assessed as Endangered (EN)
- Yellow background – Assessed as Vulnerable (VU)

Family	Binomial	Movement Pattern	IUCN Red List Category	IUCN Red List Criteria	Population Trend	Number of countries
ACIPENSERIDA E	<i>Acipenser baerii</i>	Full Migrant	Critically Endangered	A2bd	Decreasing	2
